Local block is used for decreasing the scope of a local variable. It means by using the local block we can destory a local variable memory immediatly after its usage is completed.

For example in above program

- the local variable 'p' will be available until the last line of the method

- the other local variable 'q' will be destroyed in the middle of the method execution, it is not available until the last line of this method, because we have declared this local variable 'q' inside a local block.
